Cardiovascular involvement represents the leading cause of mortality in Systemic lupus erythematosus (SLE) patients. Its most common manifestations include pericarditis, valvular affections, conduction disorders, and arterial hypertension. Conduction disturbances are rare complication in the course of systemic lupus erythematosus. We describe the case of a woman with systemic lupus erythematosus and lupus cardiomyopathy who was admitted to our hospital due to dizziness showing on the electrocardiogram Mobitz type II atrioventricular block and left anterior bundle branch block. This problem was resolved with a pacemaker implantation. *Acta Medica Medianae 2017;56(3):38-41.*

Key words: *Systemic lupus erythematosus, Mobitz type II atrioventricular block, pacemaker*
